Synthesis of Cyclic Phosphonate Analogues of (Lyso)phosphatidic Acid Using a Ring-Closing Metathesis Reaction

Honglu Zhang,[†] Ryoko Tsukuhara,[†] Gabor Tigyi,[‡] and Glenn D. Prestwich*[†]

The Department of Medicinal Chemistry, The University of Utah, 419 Wakara Way, Suite 205, Salt Lake City, Utah 84108-1257, and Department of Physiology, University of Tennessee Cancer Institute, University of Tennessee Health Science Center, Memphis, Tennessee 38163

gprestwich@pharm.utah.edu

Received April 13, 2006

We describe a versatile and efficient method for the preparation of acyloxy-substituted six-membered cyclic phosphonates using the ring-closing metathesis. After closure, the key cyclic phosphonate intermediate was dihydroxylated and converted to a new class of conformationally constrained PA and LPA analogues. The oleoyloxy-substituted cyclic phosphonate 4 had unique reactivity as a ligand, showing partial activation of the LPA₂ GPCR and weak antagonism of the LPA₁ GPCR.

Introduction

Lyso-phosphatidic acid (LPA) and phosphatidic acid (PA) elicit a rich palette of biological responses in human health and pathophysiology.¹⁻³ The majority of these cellular events are transduced via three G-protein-coupled receptors (GPCRs): LPA₁, LPA₂, and LPA₃.⁴ Recently, two additional LPA effectors, LPA₄/GPR133⁵ and the nuclear transcription factor PPAR_γ, have been reported.⁶ While the importance of LPA₁ remains unknown, PPAR_γ appears to mediate the action of LPA in

neointimal thickening during atherosclerosis.^{7,8} The importance of LPA receptors and downstream signaling events as a rich source of potential therapeutic targets has led to increased interest in the functional lipidomics of LPA and LPA binding proteins.^{9,10} In addition, LPA signaling and biosynthesis via lysoPLD¹¹ are under active investigation for new cancer therapies.¹²⁻¹⁴ In addition, LPA signaling regulates aspects of neural development.¹⁵

The pleiotropic actions of LPA can be dissected by appreciating receptor isoform-specific physiology,¹⁶ and to this end LPA analogues with isoform-selective agonist and antagonist activities are urgently needed. LPA₁ is essential for cell invasion, cancer¹⁷ and this isoform plays a crucial role in brain develop-

Syntactic Analysis

The adverse events occurring in $\geq 5\%$ of patients are shown in Table 4. The most commonly reported adverse event in both groups was somnolence, and this occurred in a higher proportion of patients with quetiapine than with risperidone (26.3% and 19.7%, respectively; $p = .04$). In both quetiapine and risperidone groups, the majority of the somnolence was rated as mild in intensity (in 70% and
