

Automated knowledge discovery to support the development of new drugs

Caroline Kant

Operational Excellence Research

Research Informatics & Knowledge Management

Merck Serono

Agenda

- The Pharma productivity challenge
- Automated Knowledge Discovery (AKD)
- AKD supports the whole pipeline
 - 1st case study: predicting safety issues
 - 2nd case study : supporting innovation
- Where we are heading
- Conclusions

A conceptual diagram illustrating the process of drug development. It features a long, straight asphalt road that recedes into the distance under a bright blue sky with scattered white clouds. The road is flanked by vibrant yellow fields. A large, white, upward-pointing arrow is superimposed on the road, pointing from the 'Concept' label at the bottom to the 'New Drug' label at the top. Both labels are in yellow boxes with red borders.

Concept

The Pharma Innovation Gap

Research Productivity is falling

The Ultimate Challenge

Transforming Data into Knowledge

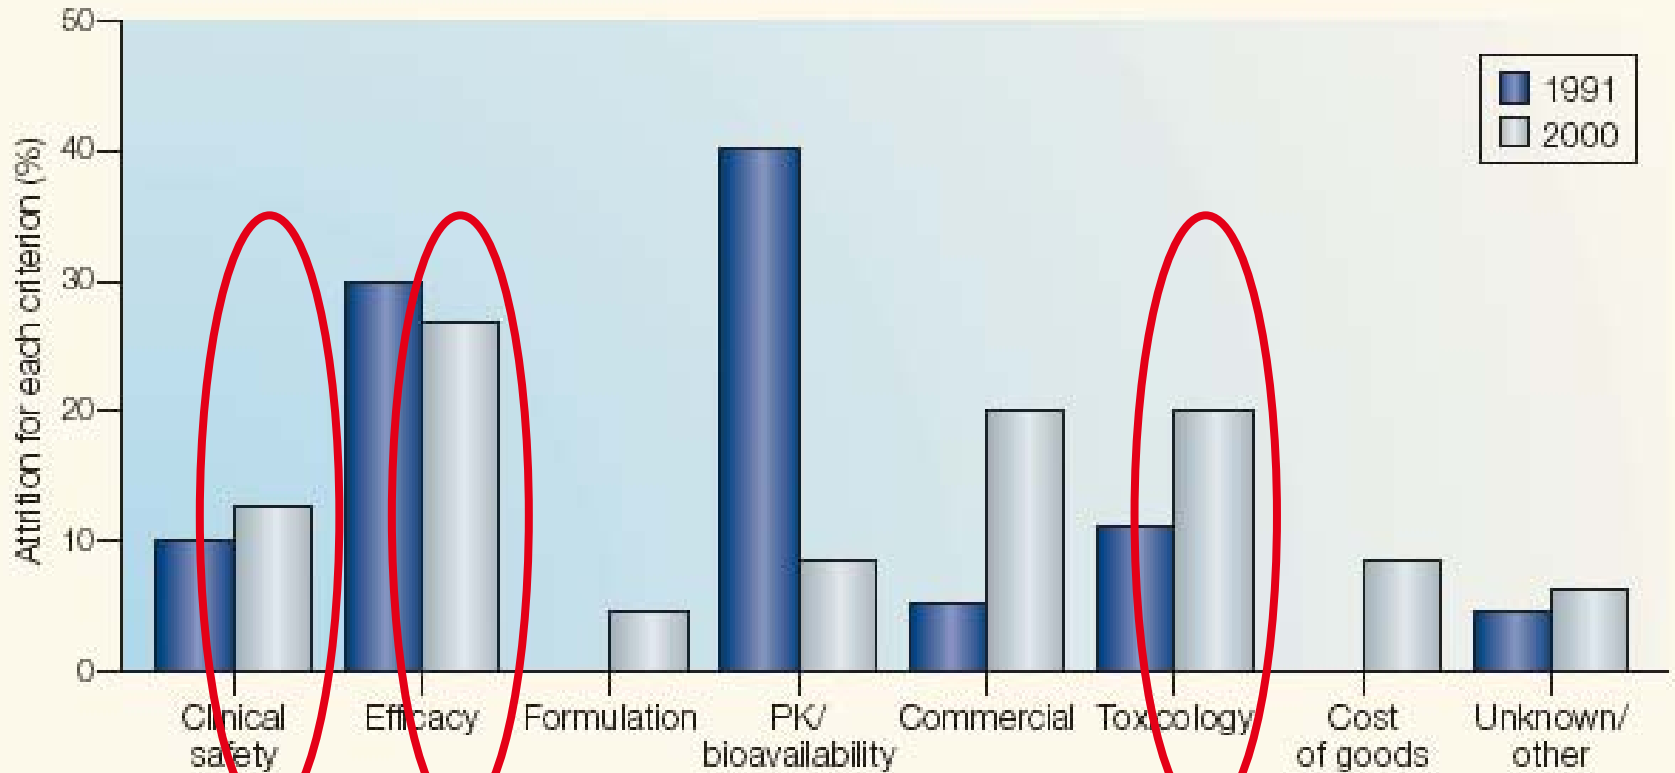

Pharma invest heavily into data

« If only we knew what we know we would be a company that is three time more profitable »
Lew Platt, former CEO of Hewlett-Packard

Why drugs fail?

Kola I & Landis J (2004) Nature Reviews Drug Discovery; 3, 711-714

Translational science challenge

Automated Knowledge Discovery Tools and Strategies

An *in silico* approach leveraging on a collection of techniques and strategies to identify and exploit knowledge on large amounts of heterogeneous data/text

- Text Mining
- Visual Text Analytics
- Semantic search
- Pathway analysis
- Semantic mapping
- Literature Base Discovery
- **Combination of tools and strategies**

Knowledge Mining

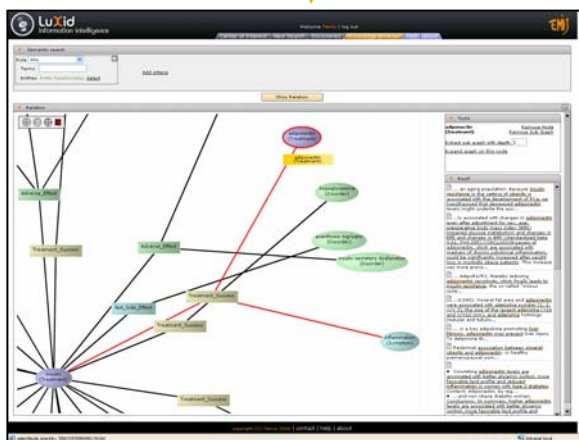

Supporting the pipeline

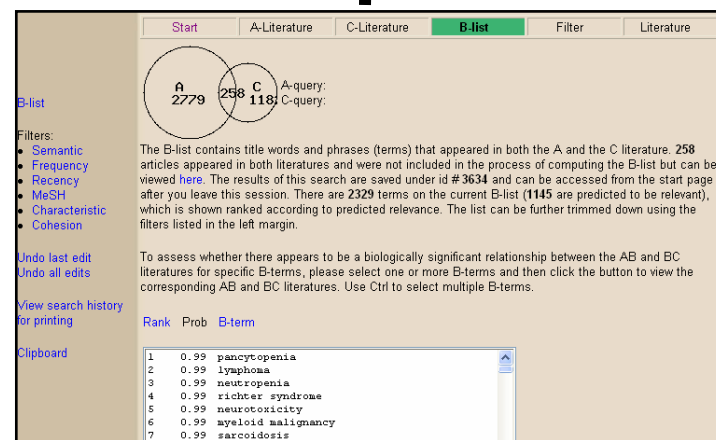

- Mechanism of Action
 - Which molecular mechanism shall be perturbed in order to cure the disease X?
 - Who is the best indication for drug Y?
- SAFETY
 - What is the rationale for the adverse event X associated with the administration of Y ?
 - What „adverse events“ observed with drugs in the same class should be considered „risk“ for compound x ?
- BIOMARKERS
 - Which biochemical feature could be used to identify a disease and monitor the effect of treatment Y for disease X ?

Integration of Visual analytics and Literature Base Discovery –Case Study #1

What „adverse events“ observed with drugs in the same class should be considered „risk“ for compound x ?

Visual Analytics

Literature Base Discovery

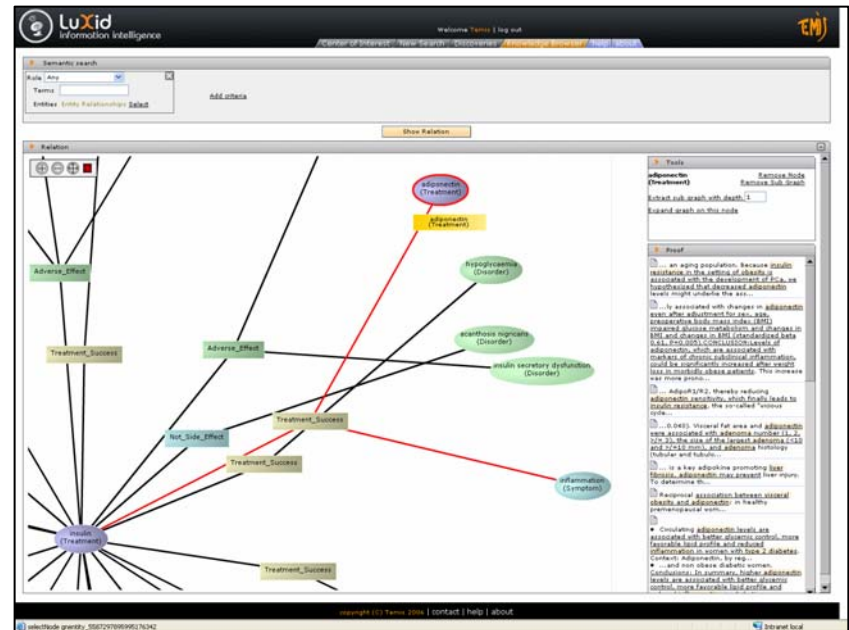

Complementary techniques,
logic knowledge extraction
workflow

Visual analytics using LUXID

– State-of-the-art Text Mining

- Search delivered 2901 Documents
- Processed automatically in 9 h on one Central Processing Unit (CPU)

D	E
	codeine 60 mg was associated with any significant increase in any patient experiencing an adverse event
14	codeine 60 mg was associated with any significant increase in any patient experiencing an adverse event
15	patient (Species) adverse effects Administration, Oral *Analgesics; AD administration & dosage Anti-Inflammatory Agents, Non-Steroidal; AD administration & dosage Codeine; AD administration & dosage Codeine; AE adverse effects Cyclooxygenase Inhibitors; AD administration & dosage Double-Blind Method Drug Combinations Humans *Molar, Third; SU surgery *Pain, Postoperative; DT drug therapy Randomized Controlled Trials Review Literature *Tooth Extraction; AE adverse effects Tooth Extraction; SN statistics & numerical data 103-90-2 (Acetaminophen); 76-57-3 (Codeine)
16	Related Treatment)
17	Psychosis (MeSH Nomenclature Disorder) Codeine can cause dependence and may induce psychosis
18	tramadol (Pharmacological Substance) adverse events for tramadol/APAP and codeine/APAP was found, except for constipation (0% vs 10.9%) and vomiting
19	Vomit (MeSH Nomenclature Symptom) adverse events for tramadol/APAP and codeine/APAP was found, except for constipation (0% vs 10.9%) and vomiting
20	Constipation (MeSH Nomenclature Symptom) adverse events for tramadol/APAP and codeine/APAP was found, except for constipation (0% vs 10.9%) and vomiting
21	poisoning Codeine Female Adult Aspirin; PO poisoning Codeine; PO poisoning Humans Introgenic Disease *Intubation, Intratracheal; AE adverse effects poisoning Codeine
22	Female *Acidosis, Renal Tubular; CI, chemically induced Adult *Anti-Inflammatory Agents, Non-Steroidal; PO poisoning Codeine; PO poisoning Humans *Hypokalemia; CI, chemically induced *Ibuprofen; PO poisoning
23	Pancreatitis is a rare adverse effect of codeine
24	Pancreatitis due to codeine
25	Pancreatitis is a rare adverse effect of codeine
26	Pancreatitis due to codeine
27	Pancreatitis (MeSH Nomenclature Disorder) codeine/acetaminophen with fewer gastrointestinal and nervous system adverse events
28	codeine/acetaminophen with fewer gastrointestinal and nervous system adverse events
29	acetaminophen (Pharmacological Substance) codeine/acetaminophen group had more patients with 1 or more

Clustering of knowledge in Luxid

Literature Based Discovery

Swanson's ABC method

ABC method: An analyze base on statistical Natural Language Processing pioneered by Dr. Don Swanson and colleagues

“ The relationships AB and BC are known, the implicate **AC relationship is a putative discovery**” Marc Weeber, 2001

Literature Based Discovery: „B“ Tool: Arrowsmith

- What is linking A with C ?

What „**adverse events**“ observed with drugs in the same class should be considered „**risk**“ for compound x ?

- Continuous interaction with the project teams
- Design experimental assays to test potential risks
- Early implementation of a risk management plan for the projects
- Follow toxicology and safety concerns all along the discovery and development process
- Better understand the biological context of the indication
- Support an informed design of the clinical trial protocol

Integration LBD and Visual analytics

Benefits and shortcomings

Visual Analytics

- +++ Fast output
- ++ Integration int / ext data
- ++ Identification of patterns
- Incomplete picture
- Precision of recall
- Data hard to interpret

Literature Base Discovery

for printing

Clipboard

Rank	Prob	B-term
1	0.99	pancytopenia
2	0.99	lymphoma
3	0.99	neutropenia
4	0.99	richter syndrome
5	0.99	neurotoxicity
6	0.99	myeloid malignancy
7	0.99	sarcoidosis

- Tedious / time consuming
- Only external data considered
- ++ Wide converge of external data
- +++ Implicit hypothesis generation

Biology modeling and simulation

Supporting innovation – Case Study #2

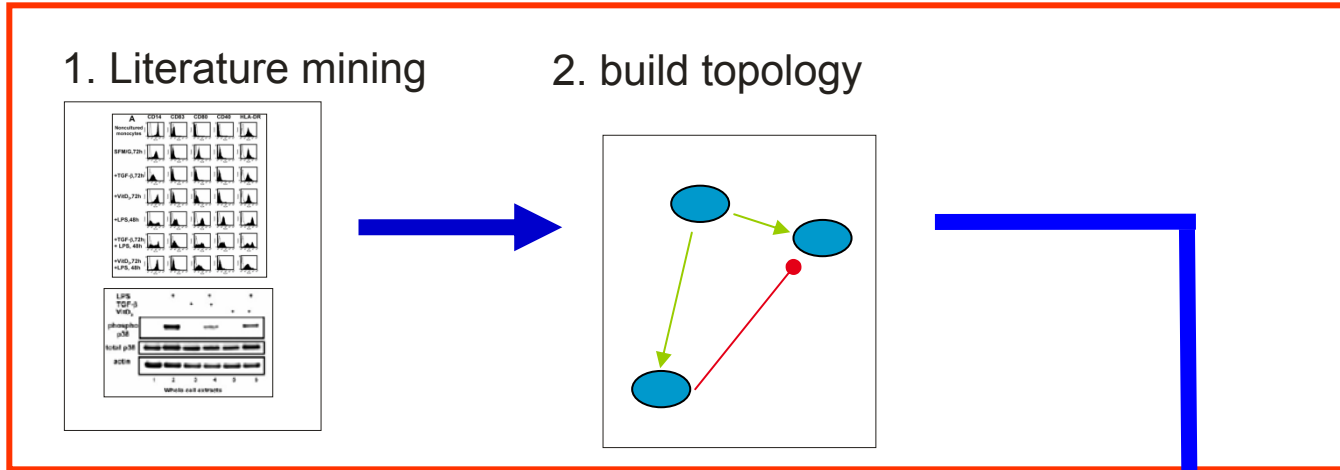

Quantitative modeling:

By perturbing the network with the over-expression or the knockout of components we can study how a network behaves and the role of its components.

- Understand the disease mechanism
- Identify and validate target
- Identify alternative pathways
- Predict efficacy
- Potential biomarker identification

AKD to build a network topology for Modeling & Simulation – Case Study #2

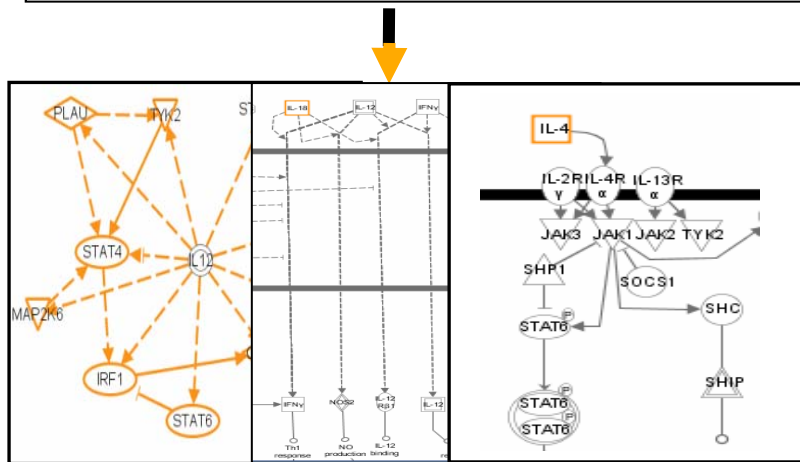

4. Experimental validation

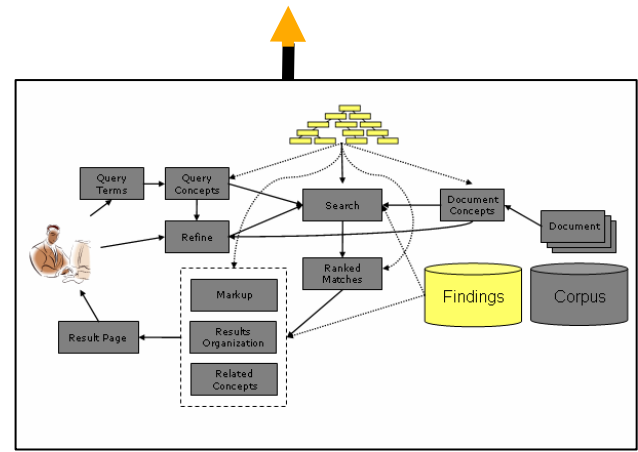

Integration PAT and Semantic search

Building the topology of molecular networks

Which „molecular mechanism“ should be „perturbed“ in order to cure the **disease X**?

Pathway analysis tools (PAT)

Semantic search

Complementary techniques,
logic knowledge extraction
workflow

AKD supports MOA and efficacy predictions

Which „**molecular mechanism**“ should be „perturbed“
in order to cure the **disease X**?

- Continuous interaction with the project teams
- Support the validation of the project's biological rationale
- Help an informed design of the project
- Design experiments to predict efficacy and simulate the compound behavior in humans
- Capture the complexity of the human disease context

Integration PAT and Semantic Search

Benefits and shortcomings

Pathway Analysis tool

- +++ Quick access to a manually curated pathways
- ++ Integration of pathways to build the network framework
- Incomplete picture
- Misleading annotation

Semantic Search

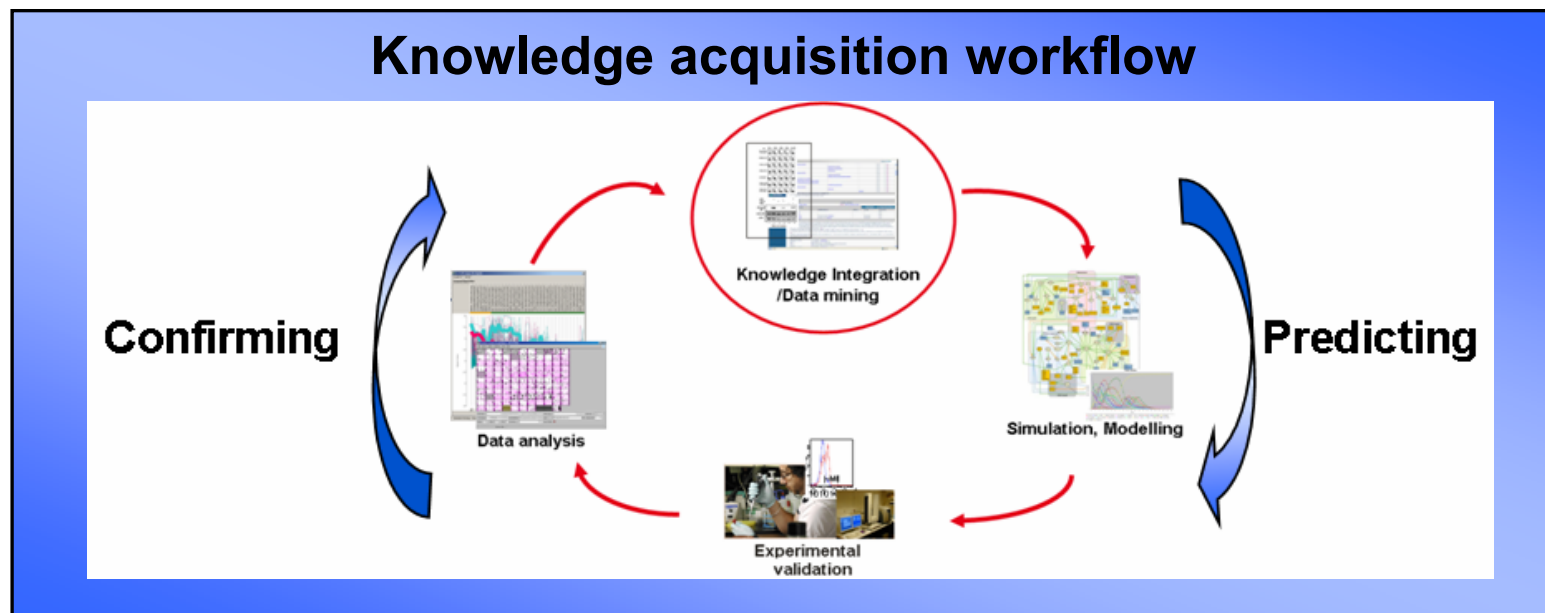

- Time consuming
- +++ Focused search
- +++ Enrich the network with wide coverage of data
- +++ Validation of the network

complementary

How to describe the best system?

Sustained knowledge acquisition

Better decision-making/ increase confidence in the drug

Conclusions

- AKD is a methodology which uses several techniques and strategies in hands of expert how helps predict a safety as well as efficacy issue and supports innovation
- AKD Assists, but does not replace human experts
- The final goal is to implement an integrated Knowledge Management System which empowers scientist to continuously convert data into knowledge
